Now you can offer your local dentists one day BruxZir® crowns by combining the CloudPoint™ System, the TS150™ mill and BruxZir NOW Milling Blocks.

Adding the TS150 mill to your CloudPoint System enables you to provide powerful one day restorative materials including BruxZir NOW, Obsidian® and others.

Introducing the TS150™ lab milling solution

- The TS150 is a fast, efficient and affordable open-source milling unit featuring a powerful air-driven 150,000-rpm spindle
- Orbital precision milling strategy ensures the cutting tool never crosses over the margin of the crown, leading to excellent marginal integrity
- Mills sintered zirconia, glass ceramic, resin nanoceramic and hybrid ceramic-polymer.

Offer your dentists one day BruxZir crowns and partner with them in the rapidly growing one visit dentistry revolution.

BruxZir® NOW is a fully sintered zirconia material indicated for the fabrication of single-unit posterior crowns. With a flexural strength greater than 800 MPa, BruxZir NOW restorations allow for minimal preparation and exceptional durability at minimal material thickness. The chip-resistant durability of BruxZir NOW zirconia also makes it ideal for bruxers who have broken natural teeth or previous restorations.

- Available in 14 pre-shaded blocks that correspond to the VITA® Classical shade system
- No oven wait of any kind required. Crowns can be designed and milled in an hour, with no need for sintering, staining, or glazing
- BruxZir NOW is manufactured from genuine BruxZir Shaded-16 and can be characterized with any Zirconia-friendly low-fusing stains and glaze.

In addition to BruxZir® NOW fully-sintered zirconia, the CloudPoint system paired with the TS150 lab milling solution expands your options to multiple one day restorative materials.

**Obsidian®**
- Lithium silicate ceramic is a beautifully esthetic, high-strength glass ceramic material indicated for the fabrication of full-contour crowns, veneers, inlays and onlays. Unlike layered ceramic or porcelain-fused-to-metal restorations, Obsidian ceramic restorations are resistant to chipping due to their monolithic composition and average flexural strength of 385 MPa.
- Exceeds the strength requirements for cemented all-ceramic restorations and can also be bonded when desired
- Resists chipping compared to a layered ceramic or PFM restoration
- Available in all VITA® Classical and Bleached shades

**Lava™ Ultimate**
- Lava® Ultimate Restorative by 3M ESPE is a resin nano ceramic material that offers an unmatched combination of durability, excellent polish retention and gentleness to the opposing teeth. This makes Lava Ultimate Restorative the tougher yet more gentle option for solving inlay and onlay cases in an easier, faster way.
- Fast, no firing and easy to mill
- Perfect for high quality, aesthetic inlays and onlays
- Nanotechnology provides an enamel-like and long-lasting polish
- Less wear to opposing enamel than glass ceramics

**VITA ENAMIC®**
- VITA ENAMIC® is ceramic-polymer hybrid material especially suitable for posterior and minimally invasive restorations. In exchange for high flexural strength, this material allows for enormous load capacity due to its stability, elasticity, and ability to absorb masticatory forces. Since the hybrid ceramic is already in its finished state, it can be inserted immediately after milling.
- Available in 5 shades
- Fast and efficient processing provides for minimal wear of milling tools and time-saving fabrication of the restoration
- Exceptional edge stability and reproduction of details ensure accurate results
